

# Why edgeSuite?

edgeSuite is a fully secure, visualization workflow solution that integrates your mission critical applications and data. edgeSuite is unique in the marketplace because it incorporates the data within your environment and the methods used to manage your business to create a single tool for both back-end and front-end solutions. When you are dealing with multiple data sets and multiple data sources, you are faced with the problem of complex navigation of different software solutions and the inability to access them simultaneously in an efficient and effective way. Additionally, edgeSuite resolves web integration issues, reducing the need for multiple portals and complex navigation needed to access information and resolve issues.

The power of edgeSuite begins with edgeData, which takes data integration to a new level by reaching out, in real-time, to retrieve and merge multiple data sets from multiple data sources into a single correlated visualization. The powerful query capabilities in the edgeData pipeline interface enable you to provide only the contextual data that is specific to each user. However our unique solution for merging data from the back-end into one seamless visualization is only one half of the total picture.

The power of edgeSuite continues with edgeWeb, the other half of the edgeSuite engine. Our patented IP for proxying web interfaces in real-time makes us unique in the industry and a primary reason why companies like BMC, HPE, IBM and others partner with us. Where companies have multiple software platforms, each with individual secure logins, edgeSuite uses Single Sign-on to manage all credentials and authentication, with the user only needing a single login password to access all integrated applications.

edgeSuite seamlessly integrates tools with simplified navigation to make a complicated technical solution simple to operate. By bringing edgeData and edgeWeb together, the power of edgeSuite is fully realized. edgeSuite's visualizations provide to each user all of the information relevant to their specific needs. Each visualization incorporates user-defined elements from across the data sources, eliminating unnecessary elements and thereby increasing efficiency for the user. Training time is reduced, increasing time to value. Additionally, the dashboard reduces visual and mental fatigue by creating a single, user-defined dashboard that incorporates only the relevant content. edgeSuite is a complete dashboard solution that not only handles all the back-end security, protocols, and data integration from multiple sources, but is also a beautiful visualization on the front-end.

Finally, the versatility of edgeSuite provides flexibility for your organization. Where other solutions can take months to implement data or UI changes, edgeSuite can make those changes in hours, with no disruption to the user-side visualization. Edge utilizes pre-built, COTS-based integrations and has taken what would normally be a development effort and turned it into a turnkey solution that is supported by on-going maintenance. This accelerates time to value, minimizes integration risk, and lowers Total Cost of Ownership, with minimal maintenance required as tool versions change.
